Unit 10 Take care of yourself!

Unit 11 Cash or charge?

Unit 12 Keep in touch

Review 3: Units 9-12

Exam A Tests

章节摘录

When your grandparents were young , wearing "smart clothes" meant their clothing was fashionable. Today, the term has a newer hi-tech meaning. Technology is entering the clothing market to create some really "smart clothes." In Germany, for example, consumers can buy an MP3 jacket. It includes both a cell phone and an MP3 player. Cloth buttons on the sleeve of the jacket control the headset and microphone which are located in the collar. If the jacket gets dirty, the electronic components can be removed and the jacket can be washed normally. In Britain, people can buy pants with the capability of a laptop. A special material was created to allow a keyboard that connects with a personal digital assistant (PDA) . The fabric is flexible enough to wear, and strong enough to wash and iron. In addition, there are also fabrics with hi-tech fibers. These comfortable clothes can act like circuit boards you can wear. New ideas in hi-tech clothing are also being developed as well. One plan is to create clothing that can monitor your body temperature and warm you even before you feel cold. People with certain medical problems can wear special clothes that monitor their vital signs, like their heart rate and temperature. If a problem occurs, a doctor can be notified. "Smart" fabrics are also being developed that can monitor pollution levels. Another material will contain a global positioning system (GPS) that can prevent people from getting lost. Not only computer geeks will be able to enjoy these clothes. Fashion designers are trying to create exciting new designs that will appeal to everyone. In the future, a "smart outfit" can be both fashionable and hi-tech.
