内容概要

《差分方程导论(英文版)(第3版)》是一本学习差分方程的本科生教程。书中将差分方程的经典方法和现代方法有机结合,包括了最新最权威的一手材料,并且在表述上足够简洁明了,适合高年级的本科生和研究生使用。《差分方程导论(英文版)(第3版)》是第三版,这版中包括了更多的证明,图表和应用,增加了许多新的内容,如,讲述高阶尺度差分方程的一章;有关一维映射的局部稳定性和全局稳定性的内容;介绍解的渐进思想的一节;levin-may定理的详细证明以及lap flour-beetle模型的最新结果

读者对象:数学专业的本科生,研究生和相关的科研人员。

书籍目录

preface to the third edition preface to the second edition preface to the first edition list of symbols

- 1 dynamics of first-order difference equations
- 1.1 introduction
- 1.2 linear first-order difference equations
- 1.2.1 important special cases
- 1.3 equilibrium points
- 1.3.1 the stair step (cobweb) diagrams
- 1.3.2 the cobweb theorem of economics
- 1.4 numerical solutions of differential equations
- 1.4.1 euler's method
- 1.4.2 a nonstandard scheme
- 1.5 criterion for the asymptotic stability of equilibrium points
- 1.6 periodic points and cycles
- 1.7 the logistic equation and bifurcation
- 1.7.1 equilibrium points
- 1.7.2 2-cycles
- 1.7.3 22-cycles
- 1.7.4 the bifurcation diagram
- 1.8 basin of attraction and global stability (optional)
- 2 linear difference equations of higher order
- 2.1 difference calculus
- 2.1.1 the power shift
- 2.1.2 factorial polynomials
- 2.1.3 the antidifference operator
- 2.2 general theory of linear difference equations
- 2.3 linear homogeneous equations with constant coefficients
- 2.4 nonhomogeneous equations: methods of undetermind coefficeints
- 2.4.1 the method of variation of constants (parameters)
- 2.5 limiting behavior of solutions
- 2.6 nonlinear equations transformable to linear equations
- 2.7 applications
- 2.7.1 propagation of annual plants
- 2.7.2 gambler's ruin
- 2.7.3 national income
- 2.7.4 the transmission of information
- 3 systems of linear difference equations
- 3.1 autonomous (time-invariant) systems
- 3.1.1 the discrete analogue of the putzer algorithm.
- 3.1.2 the development of the algorithm for an
- 3.2 the basic theory
- 3.3 the jordan form: autonomous (time-invariant) systems revisited

- 3.3.1 diagonalizable matrices
- 3.3.2 the jordan form
- 3.3.3 block-diagonal matrices
- 3.4 linear periodic systems
- 3.5 applications
- 3.5.1 markov chains
- 3.5.2 regular markov chains
- 3.5.3 absorbing markov chains
- 3.5.4 a trade model
- 3.5.5 the heat equation
- 4 stability theory
- 4.1 a norm of a matrix
- 4.2 notions of stability
- 4.3 stability of linear systems
- 4.3.1 nonautonomous linear systems
- 4.3.2 autonomous linear systems
- 4.4 phase space analysis
- 4.5 liapunov's direct, or second, method
- 4.6 stability by linear approximation
- 4.7 applications
- 4.7.1 one species with two age classes
- 4.7.2 host-parasitoid systems
- 4.7.3 a business cycle model
- 4.7.4 the nicholson-bailey model
- 4.7.5 the flour beetle case study
- 5 higher-order scalar difference equations
- 5.1 linear scalar equations
- 5.2 sufficient conditions for stability
- 5.3 stability via linearization
- 5.4 global stability of nonlinear equations
- 5.5 applications
- 5.5.1 flour beetles
- 5.5.2 a mosquito model
- 6 the z-transform method and volterra difference equations
- 6.1 definitions and examples
- 6.1.1 properties of the z-transform
- 6.2 the inverse z-transform and solutions of difference equations
- 6.2.1 the power series method
- 6.2.2 the partial fractions method
- 6.2.3 the inversion integral method
- 6.3 volterra difference equations of convolution type: the scalar
- 6.4 explicit criteria for stability of volterra equations
- 6.5 volterra systems
- 6.6 a variation of constants formula
- 6.7 the z-transform versus the laplace transform
- 7 oscillation theory
- 7.1 three-term difference equations

- 7.2 self-adjoint second-order equations
- 7.3 nonlinear difference equations
- 8 asymptotic behavior of difference equations
- 8.1 tools of approximation
- 8.2 poincare's theorem
- 8.2.1 infinite products and perron's example
- 8.3 asymptotically diagonal systems
- 8.4. high-order difference equations
- 8.5 second-order difference equations
- 8.5.1 a generalization of the poincare-perron theorem.
- 8.6 birkhoff's theorem
- 8.7 nonlinear difference equations
- 8.8 extensions of the poincare and perron theorems
- 8.8.1 an extension of perron's second theorem
- 8.8.2 poincare's theorem revisited
- 9 applications to continued fractions and orthogonal polynomials
- 9.1 continued fractions: fundamental recurrence formula
- 9.2 convergence of continued fractions
- 9.3 continued fractions and infinite series
- 9.4 classical orthogonal polynomials
- 9.5 the fundamental recurrence formula for orthogonal polynomials
- 9.6 minimal solutions, continued fractions, and orthogonal polynomials
- 10 control theory
- 10.1 introduction
- 10.1.1 discrete equivalents for continuous systems
- 10.2 controllability
- 10.2.1 controllability canonical forms
- 10.30bservability
- 10.3.10bservability canonical forms
- 10.4 stabilization by state feedback (design via pole placement)
- 10.4.1 stabilization of nonlinear systems by feedback
- 10.5 observers
- 10.5.1 eigenvalue separation theorem
- a stability of nonhyperboli fixed points of maps on the real line
- a.1 local stability of nonoscillatory nonhyperbolic maps
- a.2 local stability of oscillatory nonhyperbolic maps
- a.2.1 results with g (x)
- b the vandermonde matrix
- c stability of nondifferentiable maps
- d stable manifold and the hartman-grobman-cushing theorems
- d.1 the stable manifold theorem
- d.2 the hartman-grobman-cushing theorem
- e the levin-may theorem
- f classical orthogonal polynomials

精彩短评

- 1、内容不错,浅显易懂,不过这排版真难看,是不是世界图书出版的都这样,之前一本微分几何也 是……
- 2、没仔细看,代替饭了一下,感觉还可以吧
- 3、有利于学习经济或金融
- 4、很不错,期待还有这样的好书
- 5、比较全面系统地介绍差分方程,不过需要一定英语基础的人才能弄懂
- 6、因为偶尔发现在这方面还有很多地方可以做,所以买一本补充基本知识。
- 7、数学越是到了高深,就越要多看看国外的著作,较至国内水平绝对一流,学习差分值得一看
- 8、书挺不错的,在国内很难看到这样的书
- 9、非常经典的差分方程教材,英文版的
- 10、关于差分的入门书不多,这本很不错。
- 11、专门介绍差分方程的书很少,本书是本很好的教材,对差分方程做了比较全面深入的介绍,习题数量较多,属于入门级别的书。
- 12、书大概看了十几页,感觉还可以,外国人写书与中国人的思维不一样

精彩书评

1、在学习ARIMA模型时,发现几乎所有的教材都只是简略的介绍了差分算子、延时算子,以及两者之间的联系。而后在推导稳定域的时候,只是给出了充分条件,并没有证明充要性。接着在导出Green函数时,读者便无法理解它的由来。这时,回归到最开始的两个算子,发现有必要系统的了解一下差分方程的知识。该书第一章讲述了稳定性理论,与微分方程中稳定性理论,以及经济学的蛛网模型,数值分析的收敛性的判断有联系。我主要参考了第二章的内容。第二章是讲高阶差分方程,对于时间序列的初学者,会颇有感觉。差分算子可以类比微分算子,逆差分算子就是积分,进而类比着建立起一套运算规则。书中的例题让人觉得很亲切,当意识到ARIMA模型和高中的递推数列在模式上是一样的,(只不过增加了递推阶数,变量变成了随机变量,因而在处理方法上发生了改变),那些晦涩的符号就不再晦涩。
